Circle of Blood Windows® 95 Errata Card

- If you are experiencing graphic corruption while playing *Circle of Blood* with the high resolution install option, try reinstalling *Circle of Blood* and selecting the low resolution option. This will play the movies in a slightly smaller window, increasing performance.

- If you experience problems running the game under MS-DOS with an S3 Trio64V+ or ViRGE based video card (may be built into the motherboard), run the program S3FIX3.COM (on your CD-ROM) before running the installer and before running the game during subsequent sessions. NOTE: you MUST rerun this driver every time you wish to play the game. You may find that the screen is colorfully corrupted when you quit back to DOS after installing or playing the game but this is nothing to worry about - your computer is fine. To correct the corruption either reboot your machine or type MODE CO80 and press the **<enter>** key. Some cards (such as the Diamond Stealth 3D) may also require you to run the S3 VBE/Core 2.0 Version 3.02 (called S3VBE20.EXE) driver prior to running install or the running the game itself. This driver is available from Diamond (readily available on their web site). Please note that the game plays fine on these cards from Windows® 95.

- We have encountered poor game performance and even system crashes playing Circle of Blood on an AST Advantage Adventure series PC. The CD-ROM controller does not meet the minimum requirements for *Circle of Blood*, so you may want to try a different (new) disk controller card. If you do experience difficulties, please contact AST for more information.

- The hard disk space requirements have changed slightly. The correct requirements are:

  Minimum - 20 megs
  Medium - 159 megs
  Full - 224 megs

  (Please remember that you will also need hard disk space for saved games).

- On rare occasions when installing from DOS 7.0 mode on a Windows ® 95 machine, the program will lock up after installation is complete or after the F3 key is pressed to abort installation. This will NOT hamper gameplay, but it may leave an unnecessary directory on your hard drive. To remove this directory simply restart your machine and from the C:\ prompt type:

  DELTREE C:\SWORDTMP (and press the **<enter>** key)
